

DMEGC INTRODUCTION

企业概况

横店集团东磁股份有限公司是一家集生产、经营、科研、技术开发为一体的国家大型一档上市公司，是全国磁性行业龙头企业，也是全国磁性行业第一家通过ISO14001和ISO/TS16949认证的企业。

东磁公司软磁事业部是东磁股份有限公司下属的专门从事软磁系列产品的研究、开发和生产的事业部。下辖15家生产分厂，拥有国家级博士后工作站、浙江省磁性产品质量检测中心。主要生产各种锰锌铁氧体、镍锌铁氧体、金属磁粉心等万余种不同规格的产品，广泛应用于消费类电子、计算机、网络通信、汽车电子、绿色照明、工业控制、新能源等领域中的变压器、电感器等器件中。年产量达4万多吨，是目前全球生产规模最大、品种最全的软磁产品生产基地。

软磁事业部积数十年拼搏之经验，广采全球同行之精髓，通过多方面的合作与交流，不断更新生产工艺，提高产品质量，努力为顾客提供一流的产品和服务。

“永无止境追求质量完美，一丝不苟满足顾客需求”是东磁人坚持不懈的努力目标和行动指南，我们愿与国内外各界朋友一道携手，共创美好明天。

Hengdian Group DMEGC Magnetics Co., Ltd. Is a large-scale national listed enterprise integrating production, operation, scientific research and technology development. It is the leading enterprise in the national magnetic industry and the first enterprise in the national magnetic industry that has passed ISO14001 and ISO/TS16949 certification.

The soft magnetic business division of DMEGC is a business division specialized in the research, development and production of soft magnetic products. The soft magnetic business division manages 15 production factories, and has a national postdoctoral workstation and a magnetic product quality testing center of Zhejiang province. The main products are various of MnZn ferrites, NiZn ferrites, Alloy powder cores and others which have more than 100000 different specifications, and they are widely used in the transformer, inductor and other devices of consumer electronics, computers, network communications, automotive electronics, green lighting, industrial control, new energy and other fields. The annual output is more than 40,000 tons, and the business division is the largest production scale of the world, the most complete variety of soft magnetic products production base.

With years of hard work experience, soft magnetic business division has been striving to provide customers with first-class products and services by drawing on the best of the global peers, constantly updating production technology and improving product quality through cooperation and exchanges in various aspects.

“Neverending pursuit of perfect quality, meticulous to meet customer demand” is the goal and action guide which the DMEGC people adhere to, we are willing to work with friends from all walks of life at home and abroad to create a better tomorrow.

铁氧体主要概念与定义

● B-H曲线

当在软磁材料上加一个交变磁场时，磁通密度随磁场强度的变化如图1所示。磁滞回线(B-H曲线)描述了H与B的联系，是显示磁滞现象的闭合磁化曲线。

(图1)

初始磁导率， μ_i

它是B/H的极限值，在这里H(铁磁物质的初始磁化曲线中)值无限趋近零，可表述如下：

$$\mu_i = \lim_{H \rightarrow 0} \frac{B}{H}$$

μ_0 : 真空磁导率 ($4\pi \times 10^{-7} \text{ H/m}$)

H: 交流磁场强度(A/m)

B: 磁通密度(T)

(注) 磁性材料的本征(初始)磁导率用一只绕着导线的环形磁芯来测定，可表述如下：

$$\mu_i = \frac{L - L_0}{4\pi N^2} \times \frac{I_e}{A_e} \times 10^3$$

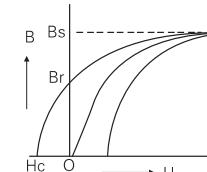

L: 带磁芯的线圈电感(H)

L_0 : 不带磁芯的线圈电感(H)

N: 线圈匝数

A_e : 磁芯有效截面积(cm^2)

I_e : 磁芯有效磁路长度(cm)

(图2)

饱和磁通密度， B_s

如图2(初始磁化曲线)所示，当完全退磁的磁芯周围的磁场强度增加时，磁通密度将从最初的“0”开始增加。最后磁通密度达到它的最大值，这个值就叫做饱和磁通密度。

剩余磁通密度， B_r

它是磁场强度减小并最后变为零以后保留在磁芯中的剩余磁通密度的值。

矫顽力， H_c

它是在反方向的磁场激化下剩余磁通密度为零时的磁场强度。

● 损耗

损耗角正切， $\tan \delta$

磁芯损耗由三种不同类型的损耗组成：磁滞损耗、涡流损耗和剩余损耗。

$$\tan \delta = \tan \delta_h + \tan \delta_e + \tan \delta_r$$

$$= h_1 X \sqrt{\frac{L}{V_1}} + e_1 X_f + r_1$$

损耗系数 $\tan \delta$ 也可表示为如下所示的阻抗与电抗的比值：

$$\tan \delta = \frac{R_m}{\omega L} = \frac{R_{eff} - R_w}{\omega L}$$

$\tan \delta_h$: 磁滞损耗因子

$\tan \delta_e$: 涡流损耗因子

$\tan \delta_r$: 剩余损耗因子

L: 带磁芯的线圈电感(H)

V_1 : 磁芯体积(cm^3)

h_1 : 磁滞损耗系数

e_1 : 涡流损耗系数

η_1 : 剩余损耗系数

f: 频率 (Hz)

 R_m : 磁芯的损耗电阻(Ω) R_{eff} : 带磁芯线圈的损耗电阻(Ω) R_w : 线圈的损耗电阻(Ω) ω : 角频率 (弧度/秒)比损耗因子, $\tan \delta / \mu_i$

它是每单位磁导率的损耗, 表示如下:

 $\tan \delta / \mu_i$ (对磁芯材料)(注) h_1 表示如下:

$$h_1 = \frac{1}{\omega L} \times \sqrt{\frac{L}{V_1}} \times \frac{R_2 - R_1}{I_2 - I_1}$$

i: 电流 (A)

 R_1 =电流*i*₁的电阻 R_2 =电流*i*₂的电阻**品质因素, Q**

品质因素是损耗角正切的倒数。

$$Q = \frac{\omega L}{R_L} = \frac{1}{\tan \delta}$$

 $\omega = 2\pi f$: 角频率 (弧度/秒) R_L : 带磁芯线圈的损耗电阻(Ω)**● 功率损耗, Pv**

功率损耗表示在高频、大磁场磁化条件下由电子变压器造成的损耗, 例如开关电源变压器。工作磁通密度B, 通常表示如下:

$$B = \frac{V}{4.44 f N A_e} \times 10^8$$

B: 磁通密度 (Gauss)

V: 线圈端电压 (V)

f: 频率 (Hz)

N: 线圈匝数

 A_e : 有效截面积(cm^2)**● 其他性质**电阻率, ρ ($\Omega \cdot m$)

通过磁芯单位截面在单位长度上的电阻

磁导率温度系数, α_μ 它是在 T_1 到 T_2 这个温度范围内温度每变化1°C磁导率的变化量。

$$\alpha_\mu = \frac{\mu_2 - \mu_1}{\mu_1} \times \frac{1}{T_2 - T_1}$$

 μ_1 : 在温度 T_1 的磁导率 μ_2 : 在温度 T_2 的磁导率**比温度系数, $\alpha_{\mu T}$**

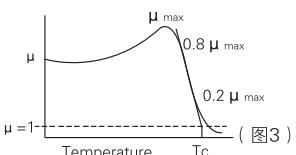

它是每单位磁导率的温度系数, 可表示为:

$$\alpha_{\mu T} = \frac{\alpha_\mu}{\mu_i}$$

居里温度, T_c 如图3所示典型磁导率与温度特性曲线, 居里温度指磁芯从铁磁状态转向顺磁状态的温度, 由 $0.8 \mu_{max}$ 和 $0.2 \mu_{max}$ 两点的连线与 $\mu = 1$ 的交点的温度得到。

因此, 一个实际磁芯温度系数由下式决定:

$$\alpha_\mu = \alpha_{\mu T} \times \mu_i$$

(注) h_1 表示如下:

$$h_1 = \frac{1}{\omega L} \times \sqrt{\frac{L}{V_1}} \times \frac{R_2 - R_1}{I_2 - I_1}$$

i: 电流 (A)

 R_1 =电流*i*₁的电阻 R_2 =电流*i*₂的电阻**密度, d (g/cm³)**

这是每单位体积磁芯的重量, 表示如下:

$$d = \frac{W}{V}$$

W: 磁芯的重量 (g)

V: 磁芯的体积 (cm³)

减落因子, DF

它是表示在恒温下磁芯完全退磁后磁导率随时间变化的参数。

$$DF = \frac{\mu_1 - \mu_2}{\lg \frac{t_2}{t_1}} \times \frac{1}{\mu_1^2} (t_2 > t_1)$$

 μ_1 : 完全退磁 t_1 分钟后初始磁导率 μ_2 : 完全退磁 t_2 分钟后初始磁导率(注) 一般, t_1 、 t_2 分别被设为10、100分钟。**气隙影响**

当磁路中有气隙时, 其损耗因子就变为带气隙损耗角正切

 $(\tan \delta)_{gap}$, 它与无气隙时损耗角正切的关系为:

$$\frac{(\tan \delta)_{gap}}{\mu_e - 1} = \frac{\tan \delta}{\mu_i}$$

因 μ_e 、 $\mu_i >> 1$, 所以有:

$$\frac{(\tan \delta)_{gap}}{\mu_e} = \frac{\tan \delta}{\mu_i}$$

由于 $\mu_e < \mu_i$, 所以开气隙后, 损耗角正切减小, Q**有效磁导率, μ_e**

如果在闭合磁路中开一个气隙, 则磁化将更加困难, 对于给定的磁场强度, 对应的磁通密度会降低, 有效磁导率与软磁材料的初始磁导率和气隙尺寸、磁路长度有关:

$$\mu_e = \frac{\mu_i}{1 + \frac{G \times \mu_i}{l_e}}$$

这个公式非常适用于计算小气隙磁路的有效磁导率, 对于较大大气隙情况下, 由于一些磁通会超出气隙正常区域范围内, 上述公式并不适用, 若用上面公式计算有效磁导率, 会导致较大误差。

电感系数, AL (nH/N²)

电感系数由下式定义:

$$AL = \frac{L}{N^2}$$

L: 带磁芯的线圈电感 (nH)

N: 线圈的匝数

直流叠加当交流磁场与直流磁场同时作用于磁芯时, 称为直流叠加。当磁芯有一个恒定的直流磁场HDC, 并在其上叠加一个幅度为 $\Delta H/2$ 的正弦磁场时, 则表示为:

$$H = H_{DC} + (\Delta H / 2) \sin(\omega t)$$

当正弦磁场作用时, 磁通密度形成小磁滞回线时, 其峰值用 $\Delta B/2$ 表示, 此时小磁滞回线在大磁滞回线内变化, 小磁滞回线的平均斜率叫增量磁导率。

$$\mu_\Delta = \frac{1}{\mu_o} \times \frac{\Delta B}{\Delta H}$$

正弦场叫工作场, 直流场叫偏磁化场或偏置场。增量磁导率随偏置场而改变。测直流叠加特性, 就是在一定偏置场下加工作场, 测其增量磁导率, 并与无直流场时的磁导率作比较。

有效参数 C_1 : 磁芯常数 A_e : 有效截面积 V_e : 磁芯有效体积 Aw : 磁芯线圈面积

le: 有效磁路长度

 A_{cp} : 中心柱截面积 A_{min} : 最小截面积

W: 磁芯重量

Main concepts and definitions

● B-H Curves

If an alternating magnetic field is applied to a soft magnetic material, the magnetic induction(B) changes with the magnetic field(H) as shown in Fig.1. The magnetic hysteresis loop, describing the relation between H and B, is a closed magnetization curve to demonstrate the hysteresis.

(Fig.1)

Initial permeability, μ_i

This is the limit value of B/H, where H is indefinitely close to zero ($H \approx 0$) at the virgin magnetization curve of ferromagnetic substance, and is derived by the following equation → is given by the following formula:

$$\mu_i = \lim_{H_0 \rightarrow 0} \frac{B}{H}$$

μ_0 : permeability in → of vacuum ($4\pi \times 10^{-7} \text{ H/m}$)

H: AC magnetic field strength (A/m)

B: AC magnetic flux density(T)

(Note) The essential permeability of a core material is measured using a toroidal core wound with a coil, and is represented by the following equation → formula:

$$\mu_i = \frac{L - L_0}{4\pi N^2} \times \frac{I_e}{A_e} \times 10^9$$

L: self-inductance of core including → with coil(H)

L_0 : self-inductance of coil without coil (H)

N: number of turns

Ae: average cross-sectional area of toroidal core

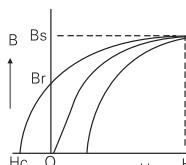

→ effective cross-sectional area of the toroidal core (cm^2)

Ie: average magnetic path length of toroidal core

→ effective magnetic path length of the toroidal core (cm)

Saturation magnetic flux density, Bs

When the strength of a DC magnetic field H is intensified around a comp lately → completely demagnetized magnetic core, the magnetic flux density B increases from the initial point: "0" as shown in Fig.2. This is called an initial magnetization curve. The magnetic flux density eventually reaches its upper limit, called the saturation magnetic flux density Bs.

(Fig.2)

Residual magnetic flux density, Br

This is the amount → value of residual magnetic flux density retained by the core after the DC magnetic field is weakened and finally removed to the level of $H=0$

→ The value of density retained by the core when the magnetic field is reduced from the saturation magnetic flux density to zero.

Coercive Force, Hc

This is the strength → value of magnetic field strength where by the flux density becomes zero under the intensification, in the opposite direction, of the DC magnetic field.

→ The value of magnetic field strength where by the flux density becomes zero under the intensification, in the opposite direction, of the magnetic field.

● Loss

Loss factor , $\tan \delta$

The core loss factors of three different types of losses:hysteresis loss, eddy-current loss and residual loss.

→ This is the sum of the hysteretic loss factor, eddy current loss factor and residual loss factor.

$$\begin{aligned} \tan \delta &= \tan \delta_h + \tan \delta_e + \tan \delta_r \\ &= h_1 X \sqrt{\frac{L}{V_1}} + e_1 X f + r_1 \end{aligned}$$

The loss coefficient $\tan \delta$ can be also represented by the ratio of resistance to reactance as follows:

$$\tan \delta = \frac{R_m}{\omega L} = \frac{R_{eff} - R_w}{\omega L}$$

$\tan \delta_h$: hysteresis loss coefficient → hysteresis loss factor

$\tan \delta_e$: eddy-current loss coefficient → eddy current loss factor

$\tan \delta_r$: residual loss coefficient → residual loss factor

L: selfinductance → self-inductance of core with coil(H)

V_1 : core volume(cm^3)

i: current(A)

h_1 : hysteresis loss coefficient

e_1 : eddy-current loss coefficient

r_1 : residual loss coefficient

F: frequency(Hz)

R_m : resistance of magnetic core (Ω)

R_{eff} : loss resistance of coil with magnetic core(Ω)

R_w : resistance of coil(Ω)

ω : angular frequency(red/sec.)

(Note) h_1 is expressed as follows:

$$h_1 = \frac{1}{\omega L} \times \sqrt{\frac{L}{V_1} \times \frac{R_2 - R_1}{i_2 - i_1}}$$

R_1 = resistance for current i_1

R_2 = resistance for current i_2

Relative loss factor , $\tan \delta / \mu_i$

This is the amount of loss per unit permeability → This is the ratio of loss factor to permeability and is expressed as follows:

$\tan \delta / \mu_i$ (for magnetic materials)

$\tan \delta / \mu_e$ (where gaps are added to the magnetic circuit → for cores with gaps in the magnetic circuit)

Quality factor,Q

The quality factor Q, is defined as the reciprocal of loss angle tangent. $\omega = 2\pi f$: angular frequency(rad/sec.)

$$Q = \frac{\omega L}{R_L} = \frac{1}{\tan \delta}$$

R_L : loss resistance of coil with magnetic core (Ω)

● Power Loss , Pv

Power loss denotes the loss by an electrical transformer, such as a switching regulator, under a magnetization condition featuring a high frequency and a large amplitude. Operating magnetic flux density, B, is generally expressed as follows:

$$B = \frac{V}{4.44 f N A_e} \times 10^8$$

B: magnetic flux density(Gauss)

V: coil terminal voltage(V)

f: frequency(Hz)

N: number of coil turns

A_e : effective cross-sectional area(cm^2)

● Other Characters

Electrical resistivity ρ ($\Omega \cdot m$)

This is the electrical resistance per unit length and cross-sectional area of a magnetic core.

Temperature coefficient, α_μ

This is the fractional difference of permeability per 1°C in a temperature range from T_1 to T_2 .

$$\alpha_\mu = \frac{\mu_2 - \mu_1}{\mu_1} \times \frac{1}{T_2 - T_1}$$

μ_1 : permeability at temperature T_1

μ_2 : permeability at temperature T_2

Relative temperature coefficient, $\alpha_{\mu r}$

This is the temperature coefficient per unit permeability and is represented by:

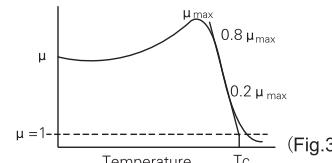

$$\alpha_{\mu r} = \frac{\alpha_\mu}{\mu_i}$$

Thus, the temperature coefficient of an actual core is obtained as follows:

$$\alpha_\mu = \alpha_{\mu r} \times \mu_i$$

Curie temperature, T_c

As shown by the typical temperature characteristic of permeability in Fig.3, the Curie temperature T_c is defined as the temperature at which the magnetic core changes from the ferromagnetic to the paramagnetic state. It is the temperature obtained at the intersection point of the horizontal line of $\mu = 1$ and the line passing through the points $0.8 \mu_{\max}$ and $0.2 \mu_{\max}$.

Density, d (g/cm^3)

This is the weight per unit volume of a magnetic core as expressed below:

$$d = \frac{W}{V}$$

W: Weight of magnetic body(g)

V: Volume of magnetic body(cm^3)

Disrecommendation factor, DF

This is the factor representing the variation of permeability through time after a complete demagnetization of the core at a constant temperature.

$$DF = \frac{\mu_1 - \mu_2}{\lg \frac{t_2}{t_1}} \times \frac{1}{\mu_1^2} (t_2 > t_1)$$

μ_1 : initial permeability t_1 minutes after complete demagnetization

μ_2 : initial permeability t_2 minutes after complete demagnetization

(Note) generally, t_1 to t_2 is set at 10 to 100 minutes.

The influence of gap

When the magnetic circuit is unclosed with a gap, the loss factor is called gap loss factor ($\tan \delta_{\text{gap}}$). The relation between gap loss factor and loss factor without the gap is:

$$\frac{(\tan \delta)_{\text{gap}}}{\mu_e - 1} = \frac{\tan \delta}{\mu_i}$$

Because $\mu_e < \mu_i > 1$, the above equation becomes

$$\frac{(\tan \delta)_{\text{gap}}}{\mu_e} = \frac{\tan \delta}{\mu_i}, (\tan \delta)_{\text{gap}} = \frac{\tan \delta}{\mu_i} \times \mu_e$$

$\mu_e < \mu_i$, so when the core to be gapped, the loss tangent decreases, and the Q value increases.

Effective permeability, μ_e

If the air-gap is introduced in a closed magnetic circuit, magnetic polarization becomes more difficult. As a result, the flux density for a given magnetic field strength is lower.

Effective permeability is dependent on the initial permeability of the soft magnetic material and the dimensions of air-gap and circuit.

$$\mu_e = \frac{\mu_i}{1 + \frac{G \times \mu_i}{l_e}}$$

Where G is the gap length and l_e is the effective length of magnetic circuit.

This simple formula is a good approximation only for small air-gap. For longer air-gaps some flux will cross the gap outside its normal area(stray flux) causing an increase of the effective permeability.

Inductance factor, AL (nH/N^2)

Inductance factor, AL, is defined as the formula below:

$$AL = \frac{L}{N^2}$$

L: inductance of the coil with magnetic core (nH)

N: number of turns

$$\mu_d = \frac{1}{\mu_0} \times \frac{\Delta B}{\Delta H}$$

Where the sine field is called applied field DC field called displacing field or bias field. The incremental permeability changes as displacing field. The measurement of DC superposition characteristic is to measure the incremental permeability in DC displacing field and to compare it to that measured without DC displacing field.

Effective parameters

C_1 : core constant

l_e : effective magnetic path length

A_e : effective cross-sectional area

A_{cp} : cross-sectional center pole area → center column cross-sectional area

V_e : effective core volume

A_{min} : minimum cross-sectional area

A_w : winding area of core → core area of the coil

W : approx. weight of core → core weight

注意事项 · Notice

1、环境和安全:

DMEGC公司所提供的产品是安全的产品，而且其材料最终可回收重复利用，对环境不会造成有害影响。

2、使用说明:

本样本书所列产品的特性规格为近似值，在使用前可联系我司确认相关数据，用户在设计的时候，应以本公司书面的图纸或承认书为准。

本样本书列出的均为标准制品，如设计应用其它规格形状和材料的产品，请与我司联系。

1、Environment and Safety:

DMEGC is committed to managing environmental and safety issues as an integral part of our business goal.In addition to actively pursuing safe working conditions.

DMEGC has installed programs to ensure continued diligence toward this objective.

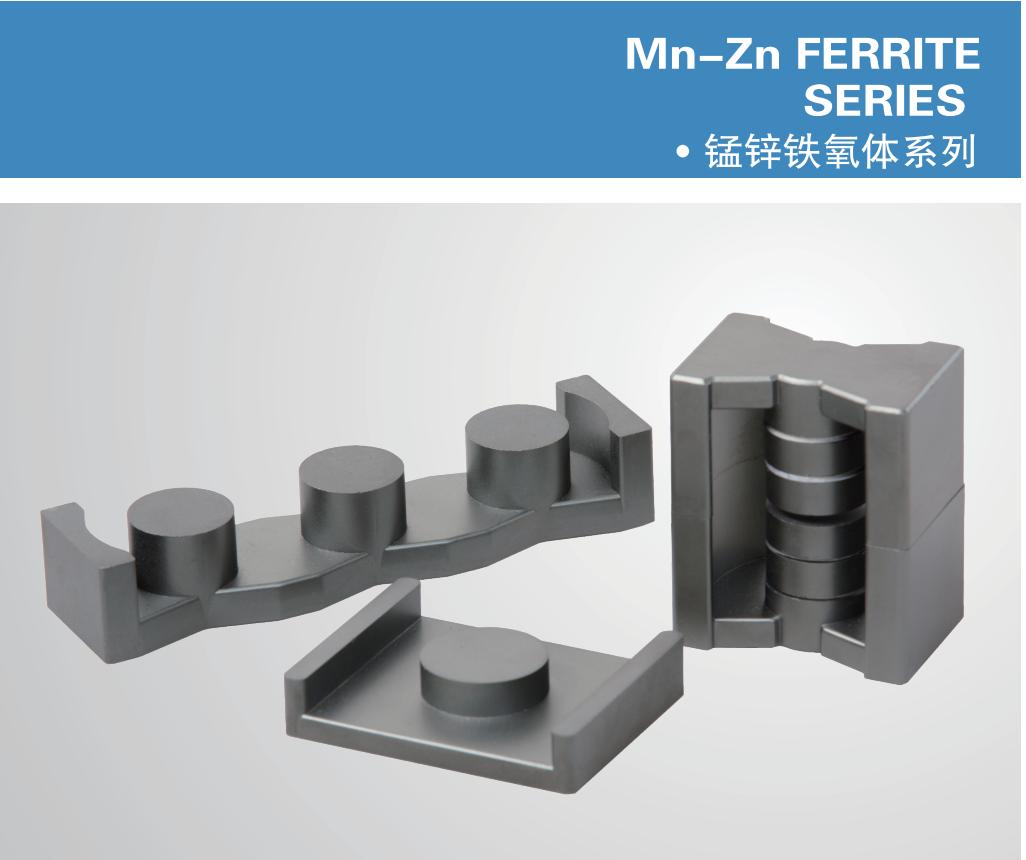

DMEGC is a determined advocate for a clean environment and complies with local and national pollution controls.Additionally, our products are compliant with the European Union's requirements for the reduction of hazardous substances(ROHS).

2、Direction for Use:

The characteristic standards for each product listed in this catalog show approximate values for some products. Some changes may also be made without notification for product improvements, etc. Before using the product, please contact our company to confirm the information. While designing, the user should be in conformity to our written drawings or acknowledgments.

This catalog shows our standard products. If there are different core shapes and material grade, please do not hesitate to contact our company.

Mn-Zn Ferrite Material

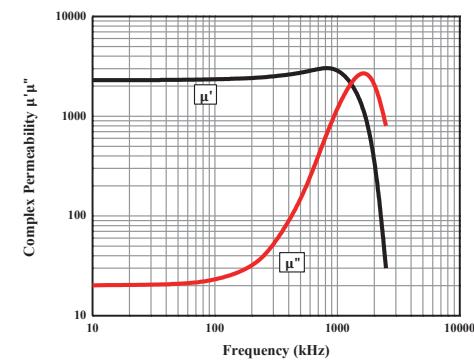

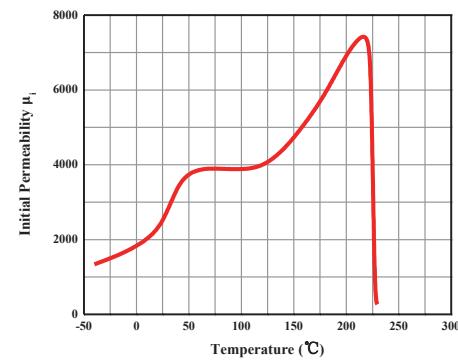

Application Area	Frequency Range	Material	Main Features	μ 25°C	Bs 25°C	Bs 100°C	Pcv 25°C	Pcv 100°C	Tc(°C)
Medium frequency Transformers Power inductors Chokes	<0.3MHz	DMR40	Low loss	2300	510 mT	390 mT	600 kW/m ³	410 kW/m ³	>215
	<0.4MHz	DMR44	Low loss	2400	510 mT	400 mT	600 kW/m ³	300 kW/m ³	>215
	<0.4MHz	DMR47	Low loss	2500	530 mT	420 mT	600 kW/m ³	280 kW/m ³	>230
	<0.4MHz	DMR95	Low loss and wide Temp.	3300	530 mT	410 mT	350 kW/m ³	320 kW/m ³	>215

密度 d (g/cm³) Density		25°C	4.85

DMR71材料特性 · DMR71 Material Characteristics

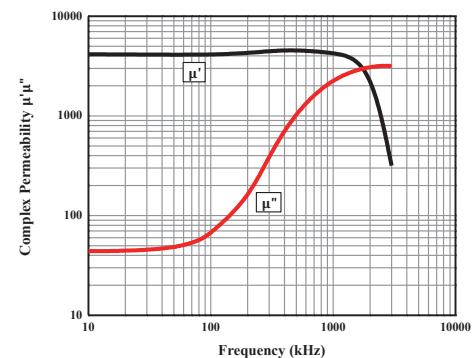

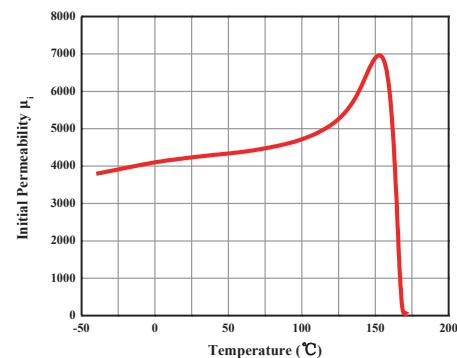

以上数据是根据标准样环 $\Phi 25 \times \Phi 15 \times 8$ 获得的典型数据，有关产品的具体性能会在此基础上有所调整。

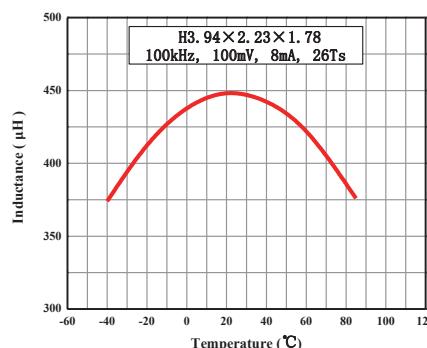

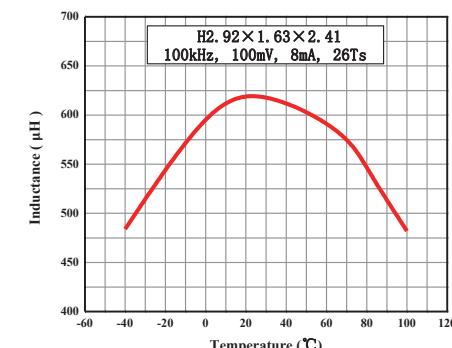

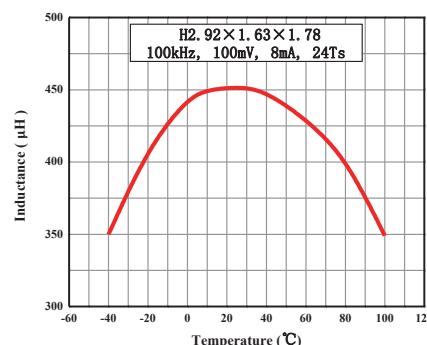

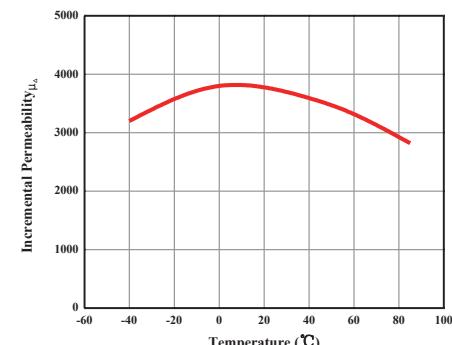

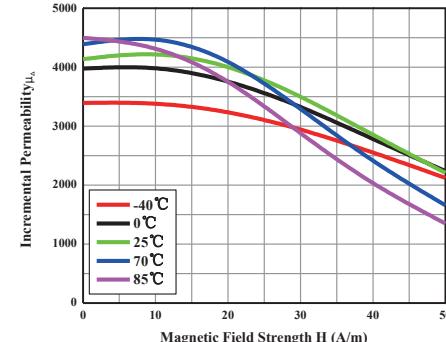

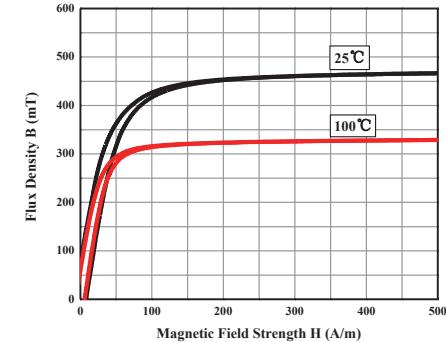

The above typical data are calculated from the standard toroid core. Specific performance of the product will be adjusted on this basis.

DMR73材料特性 · DMR73 Material Characteristics

特性 CHARACTERISTICS	测试条件 CONDITIONS		典型值 VALUE
初始磁导率 μ_i Initial Permeability	10kHz, B<0.25mT	25°C	4200±25%
饱和磁通密度 Bs (mT) Saturation Flux Density		25°C	470
剩磁 Br (mT) Residual Flux Density	50Hz, 1194A/m	25°C	45
矫顽力 Hc (A/m) Coercive Force		25°C	7
比损耗因子 $\tan\delta/\mu_i(\times 10^{-6})$ Relative Loss Factor	10kHz, 0.25mT	25°C	<3.5
	100kHz, 0.25mT		<10
居里温度 Tc (°C) Curie Temperature	10kHz, B<0.25mT		>160
密度 d (g/cm³) Density		25°C	4.9
